Abstract

Embry-Riddle Aeronautical University-Prescott has contracted with William J. Hughes FAA Technical Center to develop and maintain a website dealing with a wide variety of airport wildlife concerns. We hope to increase the transfer of information among airport wildlife staff and other interested groups. By developing an on-line wildlife strike report form (FAA Form 5200-7) associated with the website, we can enable users to access other topics such as wildlife management, bird identification information, FAA wildlife management guidelines, education, pictures, and resources. Other user services available at the website are current news, upcoming meetings and training, available jobs and discussion/forum sections. There are future plans for an interface query system.

Associated with the main site is the Aircraft Rescue and Fire Fighting (ARFF) on-line reporting system, which is part of the ARFF vehicle rollover program study. This on-line reporting system is helping the FAA Research and Development group gain information quickly and accuracy for the study.
